Chief Executive Officer
 Serpentine Jarrahdale Shire
 6 Patterson Street
 Mundijong WA 6123

Dear Sir,

RE: Development Application 235 Boomerang Rd Oldbury – Supporting Information: Nutrient Management and Containment

The landowner received written planning advice from the Shire of Serpentine Jarrahdale in July 2021. In particular, the Shire advice was concerned about the proposed development disrupting local amenity due to the potential for noise, odour, dust and pests, as well as the possibility of environmental contamination from the production of leachate.

Background

Terra Talis Pty Ltd are proposing to operate a manure bagging and garden product delivery business at the northern area of the site.

The bagging component of the business involves the receipt of bulk sheep manure from feedlots, which is bagged for commercial sale.

The garden product delivery component of the business involves the sale of other bagged products, which would be stored on site for loading, such as soil conditioner, potting mix, mulch, composts and firewood.

All bagged products are contained in polywoven or plastic bags and are stored on wooden pallets and wrapped in plastic.

Another business, EXO Sustain Recycling Pty Ltd, are also proposing to operate at the southern end of the site. This business collects green waste from customer addresses into a garbage wagon truck. The received green waste would be processed through a mulching machine (electric tub grinder) on site, prior to being exported to a licenced waste facility.

Supporting Information

The owners' intention is to conduct all manure bagging operations inside an existing shed, formerly used as a stable. To this end, the stable will be extended by the construction of an additional 52 m² roofed shed (**Appendix A**). The operation will involve trucks containing manure emptying their contents inside the shed. A bobcat will be used to progressively load the product into a hopper which supplies the bagging plant. Filled polywoven bags will then be stitched before being placed on wooden pallets and the pallets wrapped in plastic film. Such an operation, conducted entirely within a large (245 m²) roofed shed with closed doors will minimise any prospects of noise, dust or

odour impacting on neighbours. The prospect of leachate formation is negligible, as the shed roof and gutters will prevent any rainfall contacting the product.

The owners also intend to construct 625 m² impermeable floor hardstand at the rear of the manure bagging operations for the purpose of receiving domestic green waste, then putting the contents through a mill to create uniform particle size prior to exporting the material in trucks to a local licensed composting facility. To eliminate any prospect of leachate contamination, the hardstand will be composed of compacted limestone aggregate, topped with 50 mm of asphalt targeting a permeability < 10⁻⁹ m/s. Any rain falling onto this hardstand will be directed by gravity into a plastic lined evaporation pond to eliminate any prospect of leachate causing groundwater pollution (**Figure 1**). The location of the hardstand is 100 m from the nearest dwelling (north west at 241 Boomerang Rd) so loss of amenity due to noise is minimal. Green waste does not pose dust or odour issues.

The evaporation pond was designed to manage runoff from the hardstand and rainfall directly falling into the structure. The pond will be plastic lined with an UV-resistant HDPE membrane (1 mm thick, life expectancy of 15 years). The HDPE membrane is proposed to be replaced every 15 years or when non-reparable damages are observed.

As seen in **Appendix B**, the pond will not overflow throughout the seasons hence will not cause any negative impacts to the natural environment. Specifications of the evaporation pond are provided in **Table 1** below. The pond will reach its maximum capacity late September and be entirely empty by the following March. The pond will then have volume accumulating from May when evaporation starts to be lower than rainfall (**Chart 1**). As such, since the runoff water collected in the pond will constantly be subject to evaporation, no discharge to the natural environment is therefore required. Subsequently, a treatment train system is not required.

Through the years, salt will accumulate into the pond. As such, it is proposed to collect salt every three years. Collected salt can be stored in IBCs and be dispatched to landfill when full. Collection of the salt will be done manually using a shovel (if thick layer of salt) or a broom/tray (if scarce deposits). The use of this equipment will prevent damages to the liner.

Table 1: Evaporation pond specifications

Description	Specs	Unit
Pond top area	470	m ³
Top area - side length	21.7	m
Pond bottom area	94	m ³
Bottom area - side length	9.7	m
Depth	1.5	m
Volume	423	m ³
Slope	1V:4H	-

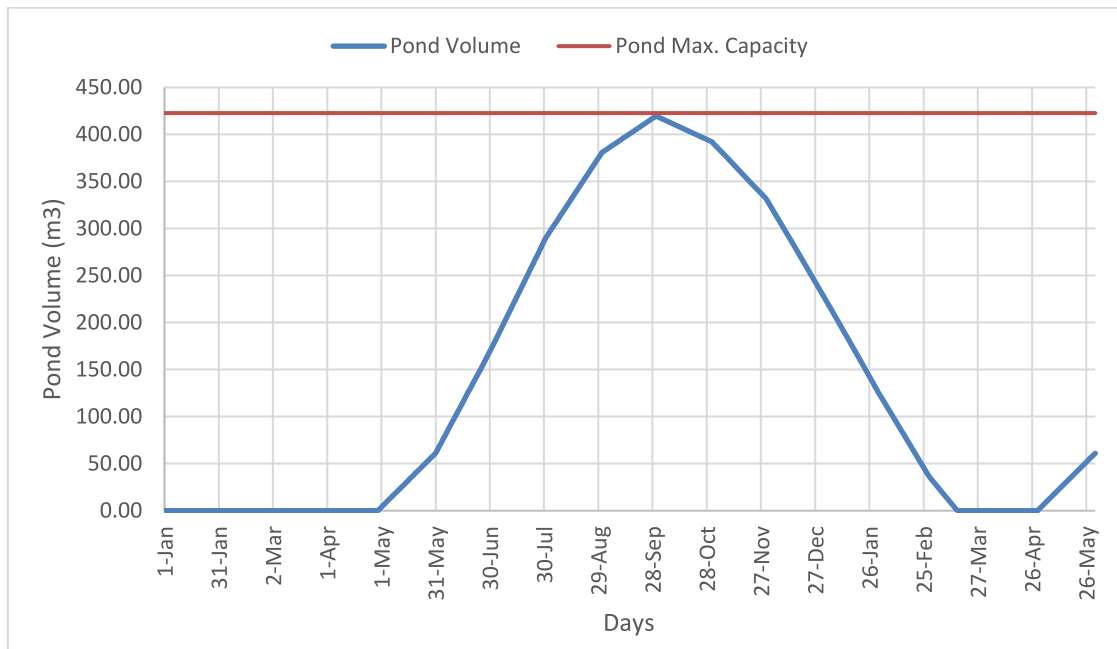

Chart 1: Pond volume through time

In conclusion, the manure bagging operation will be conducted under a roofed shed and hence will prevent stormwater contamination and any subsequent impacts to the environment.

Likewise, the proposed hardstand area / plastic-lined evaporation pond structures of the mill preparation area will fully contain runoff and leachate, hence preventing leaching of nutrients to the natural environment.

The proposed development will therefore not cause any environmental harms.

If further information is required, please do not hesitate to contact the undersigned.

Yours sincerely,

Didier Alanoix
Environmental Scientist
